

k-point convergence of the mean in-plane stress, plotted against k-point density $n_k a$ rather than mesh integers because the surface cells differ in size, so equal meshes do not mean equal sampling. (100) The production $5 \times 5 \times 1$ mesh (dashed, 25.3 Å) sits within 0.005 kbar of the densest mesh computed (50.5 Å). (110) The production $9 \times 7 \times 1$ mesh (dashed, 22.7 Å) sits within 0.010 kbar of the densest mesh computed (37.9 Å). (111) The production $9 \times 9 \times 1$ mesh (dashed, 22.7 Å) sits within 0.030 kbar of the densest mesh computed (45.5 Å).
